

TECHNICAL SEARCH AND RECONNAISSANCE (TSR) HELMET

The Technical Search and Reconnaissance (TSR) Helmet provides a level of protection against blast, fragmentation, heat and impact. The helmet weighs less than a full-scale EOD helmet, making it more suitable for missions where the operator favours lighter weight in consideration of a decreased blast threat.

The helmet includes integrated communications, ventilation, and lights (white and red). The user can control each of these via a new, simple to use Remote Control Unit. It also offers EMI/EMC Class A protection against Radio Frequency (RF) threats.

The TSR Helmet connects to a new power source (Technical Power Supply - TPS) worn on the body, to help minimize weight on the user's head.

The collar of the Med-Eng TAC 6E Suit overlaps the TSR visor for more continuous frontal protection against fragmentation.

For technical specifications, please contact your authorized Med-Eng representative.
